J. Jankowski Dynamical instability vs. thermodynamical stability

Quantum Chromodynamics - QCD

$$\Lambda_{QCD} \approx 200 \text{ MeV} \longleftrightarrow \sim 1 \text{ fm} \approx 10^{-15} \text{ m}$$

- At low energies quarks and gluons are strongly coupled
- Need for new theoretical techniques to tackle the physics

San

Phase structure at strong coupling

- Systems at strong coupling exhibit various phase structures
- Pure gluon system $\longrightarrow 1^{st}$ order phase transition (left)
- Gluons + quarks \longrightarrow smooth crossover (right)

- Model different phase structures within strongly coupled models
- Compute the spectrum of linearized perturbations
- Compute transport coefficients and non-hydrodynamic modes
- Check linear stability

Question:

Does dynamical instability has to be accompanied by a thermodynamical instability?

Method:

Use string theory based methods to formulate models at strong coupling!

SOR

Holography and Quantum Field Theory

• Holographic principle

Quantum gravity in ddimensions must have a number of DOF which scales like that of QFT in d-1 dimensions 't Hooft and Susskind '93

- String Theory realization: *AdS/CFT correspondence* Theory is *conformal* and *supersymmetric* Maldacena '97
- Extensions to *non-supersymmetric* and *non-conformal* field theories are possible
- Applications: elementary particle physics and condensed matter physics

Black holes and equilibrium states

Equilibrium state in field theory ↔ black hole in dual spacetime Field theory temperature ↔ Hawking temperature

DQ C

- To model some non-trivial physics of the boundary theory couple scalar field to gravity theory
- Phase structure is determined by the bulk scalar field interactions quantified by a potential $V(\phi)$
- It is possible to tune parameters to mimic
 - \rightarrow crossover e.g. QCD
 - $\rightarrow 1^{\rm st}$ order phase transition e.g. pure gluon systems
 - $\rightarrow 2^{\rm nd}$ order phase transition

U. Gursoy, *et.al.* JHEP **0905**, 033 (2009) S. S. Gubser, A. Nellore, Phys. Rev. D **78** (2008) 086007

Linear response and Quasinormal modes

• Perturb the system $\mathcal{L} = \mathcal{L}_0 + h_{ij}\delta^3(x)\delta(t)T^{ij}(x)$ the response is the *retarded Green's* function

$$G_R(\omega,k) \propto i \int dt d^3 x \ heta(t) e^{ikx-i\omega t} \langle [T_{ij}(x,t), T_{kl}(0)] \rangle$$

 Quasinormal modes, i.e., solutions of linearized fluctuation equations correspond to poles of holographic retarded Green's functions. In general

$$\omega_n(k) = \Omega_n(k) - i\Gamma_n(k)$$

where $n = 1, 2, 3, ..., \Omega_n(k)$ -oscillation frequency, $\Gamma_n(k)$ -damping rate. Stable modes have $\Gamma_n(k) > 0$.

nan

Linear response and Quasinormal modes

• Hydrodynamic mode is defined by

$$\lim_{k\to 0}\omega_{\rm H}(k)=0$$

The sound mode

$$\omega(k) = \pm c_s k - \frac{i}{2T} \left(\frac{4}{3}\frac{\eta}{s} + \frac{\zeta}{s}\right) k^2 + O(k^3)$$

 $\eta-{\rm shear}$ viscosity, $\zeta-{\rm bulk}$ viscosity, $s-{\rm entropy}$ density, $c_s-{\rm speed}$ of sound, $T-{\rm temperature}$

In holographic models also *non-hydrodynamic* modes are present

P. K. Kovtun, A. O. Starinets, Phys. Rev. D 72, 086009 (2005)

J. Jankowski Dynamical instability vs. thermodynamical stability

Full holographic scan

- Below T_m no black hole solution exists
- Various lines represent different black hole phases with different properties

J. Jankowski Dynamical instability vs. thermodynamical stability

nac

Dynamical instability

- Quasinormal modes at $T = 1.027 T_m$
- System displays dynamical instability despite thermodynamical stability!

nan

• When $c_s^2 < 0$ we have purely damped hydro-modes

$$\omega \approx \pm i |c_s| k - \frac{i}{2T} \left(\frac{4}{3} \frac{\eta}{s} + \frac{\zeta}{s}\right) k^2$$

so for small enough k we have $\operatorname{Im} \omega > 0$

- For a finite range of momenta this mode is present
- This appears for systems with a 1st order phase transition; spinodal instability
- This phenomenon occurs e.g. in nuclear matter

P. Chomaz, M. Colonna, J. Randrup, Phys. Rept. 389, 263 (2004)

Sar

The second example

- Transition between two different black hole solutions
- $\bullet\,$ Other example of holographic $1^{\rm st}$ order phase transition
- As in the previous case there exists minimal temperature T_m
- For the unstable region (red-dashed line) we have $c_s^2 < 0$

Holographic spinodal instability

- $\bullet\,$ Modes for $\,T\simeq 1.06\,T_m$ where $c_s^2\simeq -0.1$
- Hydrodynamic mode follows the thermodynamic instability
- Non-hydrodynamic modes have weak momentum dependence

- Thermodynamic instability \rightarrow dynamical instability
- Converse is not true!

U. Gursoy, A. Jansen, W. van der Schee, arXiv:1603.07724 [hep-th]

- Non-trivial phase structure limits the applicability of hydrodynamics
- In most cases non-hydro degrees of freedom have very weak dependence on k

Question:

What is field theory interpretation of non-hydrodynamic quasinormal modes?
